

odML templates generator from relational database

JEŽEK, P., KRAUZ, J. *odML templates generator from relational database*. 2014.

Data management systems typically include database and user interface, which allows access to stored data. Common shortcoming of these user interfaces is their strong dependence on the structure of the database. User interfaces are designed for specific system and can not be easily reused for another. This tool is able to generate platform-independent odML template for any relational database. These templates describing database structure can be used for creation of the graphical interface of the client application.
